

Who is a candidate?

Candidates for this procedure include anyone that has had poor permanent makeup or tattoos that they want removed from their bodies. However, there are circumstances that may effect the results and/or exclude you from receiving this treatment if the following apply;

- People taking blood thinners or have bleeding disorders may bleed lightly during this procedure and should consult with a doctor before proceeding.
- People with skin irritations near the area such as sunburn, severe acne, eczema or psoriasis would be extremely sensitive to the procedure and it will be painful, resulting in poor results.
- **People using acids, anti-aging, acne and retinol products should be stopped at least 2 weeks prior to the appointment.**
- The use of **Accutane** within last year compromises the skin and therefore makes it unsuitable for tattooing.
- A person with a history of keloid scarring may be a candidate assuming they've had tattoos with no evidence of keloids. However, it's possible to develop keloid scarring.
- People will uncontrolled auto-immune deficiencies - Lupus, Alopecia, etc.
- Pregnant women or women who think they might be, are not candidates due to the chance of infection during after care.
- Chemotherapy patients will need to wait until their treatment is complete and they are healthy.

Preparation for Treatment

Preparation is key for good results. Maximize your results and minimize bleeding and sensitivity by doing the following;

- Avoid blood thinning meds and supplements, caffeine and alcohol **at least 24 hours before** your appointment.
- Stop all retinol, acne and anti-aging treatments, and skin treatments at least **2 weeks before** your appointment
- Avoid chemical peels for **6 weeks prior** to every appointment, if applicable.

The Process

A natural saline solution, called Li-FT is implanted over existing permanent makeup or small tattoos using a machine and needles. Implanting the solution into the skin breaks up the healed pigment, and begins to lift the pigment out of the skin by osmosis. The pigment pulls toward the surface of the skin thanks to the saline solution, and becomes a scab. The scab then falls off and leaves a lightened tattoo.

Li-FT is made by Li Pigments in a state licensed and regulated manufacturing lab under sterile conditions and it's independently tested for safety. It is a non-acid, high concentrate, saline based solution. The ingredients are:

- *Lemon seed extract* and *orange seed extract* - aids in fading and exfoliation
- *Aloe vera* - aids in skin conditioning
- *Sterile water*

The consistency is that of a smooth gel, with no separation, which makes it very easy to use and safe since it stays put.

Treatment Areas

Currently, I offer saline removal for the brow area and small body tattoos.

Expectations

The number of sessions needed will vary by individual. Determining factors include the depth and saturation of pigment as well as the end goal.

Complete removal may require several sessions. However, if the goal is correction of shape and/or color, fewer sessions may be needed.

Esthetic Treatment Prices

Facials are tailored to your specific needs. They may include chemical peels, dermaplane, and/or microdermabrasion.

Introductory Custom Facial	\$60
